Health monitoring

Guide for tetrachloroethylene
Introduction

This guide is intended to be read by a registered medical practitioner with experience in health monitoring who is engaged by a person conducting a business or undertaking (PCBU) to carry out or supervise health monitoring. It provides practical guidance to registered medical practitioners about requirements under the work health and safety (WHS) laws for health monitoring.

This guide applies to all workplaces covered by the WHS Regulations where health monitoring is required.

How to use this guide

This guide includes references to the legal requirements under the WHS Act and WHS Regulations. These are included for convenience only and should not be relied on in place of the full text of the WHS Act or WHS Regulations.

The words ‘must’, ‘requires’ or ‘mandatory’ indicate a legal requirement exists that must be complied with. The word ‘should’ is used in this guide to indicate a recommended course of action, while ‘may’ is used to indicate an optional course of action.

This guide provides information for those registered medical practitioners engaged by a PCBU to carry out or supervise health monitoring for workers. This guidance should be read in conjunction with the following:

- Health monitoring guide for registered medical practitioners
- Health monitoring guides for hazardous chemicals
- Health monitoring guide for workers
- Health monitoring guide for persons conducting business or undertakings (PCBUs).

Health monitoring under the WHS Regulations

In certain circumstances, the model WHS Regulations place duties on a PCBU to provide health monitoring to workers. These requirements arise if the worker is carrying out work with hazardous chemicals including lead and asbestos. In addition, the work being carried out must be the kind of work specified in the WHS Regulations. A PCBU has the duty to determine if health monitoring is required.

The WHS Regulations prescribe that health monitoring is carried out by or supervised by a registered medical practitioner with experience in health monitoring.
Tetrachloroethylene (CAS 127-18-4) is a colourless, volatile, non-flammable, chlorinated hydrocarbon. It is used as a solvent and chemical intermediate.

Tetrachloroethylene has an ether-like odour that may emit toxic fumes of phosgene when exposed to sunlight or flames.

*Synonym:* perchloroethylene.

**Work activities that may represent a high risk exposure**

Under the Work Health and Safety (WHS) Regulations, tetrachloroethylene is listed as a restricted hazardous chemical and must not be used for spray painting without authorisation from a relevant WHS regulator.

Common uses for tetrachloroethylene are in textile processing and cleaning, degreasing and dry cleaning.

The major uses of tetrachloroethylene are:

- as a solvent in dry cleaning
- as a degreasing agent in metal cleaning including railway cleaning
- for processing and finishing textiles
- manufacture and use for cleaning automotive products
- used to kill parasitic worms
- manufacture of fluorocarbons
- pesticides, mostly in grain fumigation
- as insulating fluid and cooling gas in electrical transformers
- paint, printing and adhesive manufacture and use
- coal industry
- petroleum refining, and
- carpet cleaning.

The transport and distribution industries may also pose an exposure risk.

**Sources of non-occupational exposure**

Tetrachloroethylene can be found as a contaminant in water and food. Non-occupational exposure can occur through:

- ambient air – when released evaporative losses during dry cleaning, during manufacture, from use in metal degreasing, in production of fluorocarbons and other chemicals, in the textile industry, and in miscellaneous solvent-associated applications
- drinking water – when due to improper disposal contaminating land and ground water sources especially around waste disposal and industrial sites, and
- fresh dry cleaning.

1. **Health monitoring for tetrachloroethylene under the WHS Regulations**

   Collection of demographic, medical and occupational history
   Physical examination with emphasis on the central nervous, respiratory and reproductive systems and skin
   Tetrachloroethylene blood level prior to shift
**Health monitoring before starting work in a tetrachloroethylene process**

Health monitoring for tetrachloroethylene may be required before the worker starts work so that changes to the worker’s health can be detected.

Initial discussions about a health monitoring program should include:

- possible health effects from exposure to tetrachloroethylene
- how to recognise and report symptoms, and
- what is involved in the health monitoring program, for example the frequency of testing and the tests that may be needed.

An initial physical examination by the registered medical practitioner should place emphasis on the central nervous system (CNS), respiratory system, reproductive system and skin if work and medical history indicates this is necessary.

Tetrachloroethylene is a respiratory irritant and it is important to investigate respiratory symptoms. However, spirometry may not be required at this stage.

If frequent or potentially high exposure (half of the eight hour time weighted average (TWA) or more) is suspected as part of on-going work, it is recommended to conduct liver and kidney function tests prior to commencing work and at regular intervals thereafter.

**During exposure to a tetrachloroethylene process**

**2. Monitoring exposure to tetrachloroethylene**

Where workers are exposed, suspected of being exposed or are concerned about exposure to tetrachloroethylene, the person conducting the business or undertaking (PCBU) has a duty to arrange a health monitoring appointment with the registered medical practitioner. For example, an appointment should be arranged following spills or loss of containment of tetrachloroethylene resulting in excessive exposure to workers or when workers develop symptoms of tetrachloroethylene exposure.

Absorption of tetrachloroethylene via inhalation is high (60-90 per cent) with uptake increased during exercise. Tetrachloroethylene may also be absorbed through the skin. Tetrachloroethylene is only slowly metabolised and accumulates in fatty tissue as the unchanged compound.

Regardless of the route of exposure, the main route of elimination of absorbed tetrachloroethylene is via exhalation as the unchanged compound (around 95 per cent). The major urinary metabolite is trichloroacetic acid, representing one to three per cent of the inhaled dose.

According to the WHS laws, blood levels of tetrachloroethylene should be used in a health monitoring program for this compound. At this stage, there is no agreed biological exposure standard for tetrachloroethylene in blood; however, the following biological exposure limits have been established by reputable international agencies:

**Biological exposure guide for tetrachloroethylene:**

*Blood tetrachloroethylene:*

0.4-0.5 mg/L

This may be used as a guide in a health monitoring program for tetrachloroethylene.
Given the toxicokinetics of tetrachloroethylene, in particular the compartmentalisation of tetrachloroethylene in adipose tissue, a sampling time prior to a workshift, after preceding shifts, has been recommended.

Tetrachloroethylene blood concentrations of persons not occupationally exposed range below 1 ppb (0.001 mg/L).

**Other health monitoring methods**

Other tests that may be used to test the worker’s tetrachloroethylene exposure levels:

- exhaled air levels of tetrachloroethylene, or
- urinary trichloroacetic acid.

Given the nature of the metabolism and elimination of tetrachloroethylene, tetrachloroethylene concentrations in exhaled air and blood are less variable than urinary concentrations of the metabolite, trichloroacetic acid. Furthermore, trichloroacetic acid is a metabolite of other chlorinated solvents, such as trichloroethylene and 1,1,1-trichloroethane. Therefore, measurement of urinary trichloroacetic acid levels is less specific and more variable than exhaled air or blood tetrachloroethylene levels as a measure of tetrachloroethylene exposure.

If urinalysis is performed, the following values may be used as a guide for assessing exposure to tetrachloroethylene:

**Urinary trichloroacetic acid**: 0.02 mmol/L (3.5 mg/L)

Urine samples should be collected at the end of the work week.

If exhaled air concentrations are measured, the following value may be used as a guide for assessing exposure to tetrachloroethylene:

**Exhaled air tetrachloroethylene concentration**: 3 ppm

Expired breath samples should be taken pre-shift, next day (16 hours after end of shift; for similar reasons to those regarding blood sampling) in an uncontaminated or ‘clean’ area.

**Workplace exposure standard**

The workplace exposure standard for tetrachloroethylene is:

- TWA of 50 ppm (340 mg/m³), and
- short term (15 minute time weighted average) exposure limit (STEL) of 150 ppm (1020 mg/m³).

A physical examination and blood testing may be indicated if the results of air monitoring indicate frequent or potentially high exposure (half of the TWA or above).

**Removal from work**

Where a medical examination indicates the worker is displaying symptoms of exposure to tetrachloroethylene or where results of biological monitoring indicate exposure that may

---

1. See Chemical analysis branch handbook, 9th Edition, Workplace and biological monitoring exposure analysis, WorkCover NSW (PDF 3.39MB) for more details
cause adverse health effects, the registered medical practitioner should consider recommending the worker be removed from tetrachloroethylene-related work.

When removal from tetrachloroethylene-related work is indicated the registered medical practitioner must provide the PCBU with the following recommendations:

- the worker should be removed from work with tetrachloroethylene, and
- the PCBU should review control measures and carry out recommended remedial action.

The worker must be informed of the results of health monitoring.

**Return to work**

Should a worker be removed from tetrachloroethylene-related work, they must not return until the registered medical practitioner has:

- assessed them as medically fit, and
- made a recommendation to the PCBU that the worker can return to remediated tetrachloroethylene-related work.

This assessment should take into consideration the clinical condition of the worker, the resolution of symptoms and remediation of the circumstances that led to the symptoms if possible.

**At termination of work in a tetrachloroethylene process**

3. **Final medical examination**

A collection of a specimen of blood for tetrachloroethylene levels should be collected on the last shift on the last day of work and a final medical examination carried out by the registered medical practitioner as soon as practicable thereafter.

Workers with health conditions or continuing symptoms due to tetrachloroethylene exposure should be advised to seek continuing medical examinations as organised by the registered medical practitioner supervising the health monitoring program.

A health monitoring report from the registered medical practitioner should be provided to the PCBU as soon as practicable after the completion of the monitoring program, and at regular intervals for longer term or ongoing health monitoring processes. The report must include:

- the name and date of birth of the worker
- the name and registration number of the registered medical practitioner
- the name and address of the PCBU who commissioned the health monitoring
- the date of the health monitoring
- any test results that indicate whether or not the worker has been exposed to a hazardous chemical
- any advice that test results indicate that the worker may have contracted an injury, illness or disease as a result of carrying out the work that triggered the requirement for health monitoring
- any recommendation that the PCBU take remedial measures, including whether the worker can continue to carry out the type of work that triggered the requirement for health monitoring, and
- whether medical counselling is required for the worker in relation to the work that triggered the requirement for health monitoring.
Potential health effects following use of tetrachloroethylene

4. Route of occupational exposure
The primary routes of occupational exposure are via inhalation and skin contact. Accidental ingestion may be possible, especially when eating or smoking with contaminated hands. Tetrachloroethylene is readily absorbed following inhalation and oral exposure.

5. Target organ/effect
The target organs and potential effects of tetrachloroethylene exposure include:

<table>
<thead>
<tr>
<th>Target organ</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Central nervous system</td>
<td>• CNS depression, fatigue, dizziness, headache, light-headedness</td>
</tr>
<tr>
<td></td>
<td>• Sedation</td>
</tr>
<tr>
<td></td>
<td>• Coma</td>
</tr>
<tr>
<td></td>
<td>• Death</td>
</tr>
<tr>
<td>Liver</td>
<td>• Hepatic damage with jaundice</td>
</tr>
<tr>
<td>Skin</td>
<td>• Severe irritation</td>
</tr>
<tr>
<td></td>
<td>• Dry skin</td>
</tr>
<tr>
<td></td>
<td>• Redness</td>
</tr>
<tr>
<td></td>
<td>• Burning sensation</td>
</tr>
<tr>
<td>Kidneys</td>
<td>• Glomerular or tubular dysfunction</td>
</tr>
<tr>
<td>Respiratory tract</td>
<td>• Irritation</td>
</tr>
<tr>
<td>Eyes</td>
<td>• Irritation</td>
</tr>
<tr>
<td></td>
<td>• Burning sensation</td>
</tr>
</tbody>
</table>

6. Acute effects
CNS
CNS symptoms from exposure to tetrachloroethylene may include:

- light-headedness
- fatigue
- headache
- irritability
- vertigo
- dizziness
- loss of coordination
- mild elation
- exhilaration
- difficulty speaking
- impaired concentration
- reversible mood and behavioural changes
- hallucinations
- severe psychosis
- agitation
- ataxia
- drowsiness
- loss of consciousness
- seizures, or
- coma.

**Respiratory system**

Respiratory symptoms from tetrachloroethylene exposure may include:

- upper respiratory tract irritation
- cough
- chest tightness
- asthma
- hypersensitivity pneumonitis, and
- pulmonary oedema.

**Skin**

Dermal contact with tetrachloroethylene may cause:

- irritation
- skin erythema, and
- blistering.

**Eyes**

Ocular symptoms of tetrachloroethylene exposure may include:

- irritation
- burning sensations
- impairment in visual functions including colour discrimination and contrast sensitivity, and
- alterations in visual contrast sensitivity.

**Gastrointestinal**

Symptoms from ingestion of tetrachloroethylene may include:

- gastric irritation
- nausea, and
- vomiting.

7. **Chronic effects**

The major effects from chronic inhalation exposure are CNS effects. This may lead to:

- memory and concentration impairment
- vision disturbances
- dizziness
- irritability
- unsteady gait
- sleep disturbances, and
- peripheral neuropathy.

Chronic skin exposure may lead to irritation and contact dermatitis.
Chronic exposure may also cause:

- liver and kidney abnormalities, and
- disturbances of the reproductive system including:
  - menstrual disorders
  - spontaneous abortions
  - sperm abnormalities, and
  - decreased fertility.

Liver abnormalities may include:

- jaundice
- abnormal liver function, and
- hepatocellular damage.

Chronic exposure may result in abnormal renal function, such as glomerular dysfunction, tubular dysfunction or acute renal failure.

8. Carcinogenicity

Tetrachloroethylene has been classified as a Category 2 carcinogen according to the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as it is suspected of causing cancer in humans.

9. GHS classification

The following GHS health hazard classification for tetrachloroethylene has been taken from Safe Work Australia’s Hazardous Chemicals Information System:

| Hazard category | Carcinogenicity – category 2 |

Health monitoring report – Tetrachloroethylene

This health monitoring report is a confidential health record and must not be disclosed to another person except in accordance with the Work Health and Safety (WHS) Regulations or with the consent of the worker.

There are two sections. Complete both sections and all questions as applicable.

**Section 1** A copy of this section should be forwarded to the person conducting the business or undertaking (PCBU) who has engaged your services.

**Section 2** may contain confidential health information. Information that is required to be given to the PCBU should be summarised in Section 1.

---

## Section 1 – A copy of this section to be provided to the PCBU
